

Dustcontrol Green System at Maintec 2011

Dustcontrol are delighted to be exhibiting at this year's Maintec exhibition at the NEC in March. A Swedish company which develops and markets stationary and mobile vacuum extraction systems, air cleaners and suction casings for cleaning and source extraction, Dustcontrol provides a cleaner and more efficient production environment. Research and development into new and existing products is a high priority to us. Dustcontrol has its own development, production, warehouse and sales along with subsidiaries or agents in 21 countries globally.

To "think green" is a major issue for many companies. Wouldn't it be great to reduce environmental damage and at the same time make financial savings? The DC Green System is a concept for the control of vacuum producers and radial blowers that helps your company to save energy.

Dustcontrol's new concept, the DC Green System used with vacuum turbo-pumps, can offer you an energy saving with existing or new Dustcontrol machines of 40-90 per cent. In relation to the number of users, the RPM is frequency controlled using the DC Green System. The vacuum producer automatically switches to a saving mode when it's not in use. This smart system reduces energy consumption and therefore contributes to financial savings. Depending on individual cases and the current market price for electricity; payback time for the purchase of the DC Green System is generally between 1-5 years. Further benefits with the DC Green System are that you will gain a more constant pressure level in your system and therefore, a more constant airflow at your outlets than in former solutions. There are no limits on how large the system can be.

Currently we are finding demand for vacuum cleaning systems for single production lines. This enables the customer to have a dedicated vac system for each area of the factory and generally have the vac producer in that same area. With our DC 11 Module and Green System, installation is quick and easy and with no requirement for micro-switches, it is just a question of 'plug and play'. Benefits to the customer are a reduction in mobile machines, system ownership by department, the ability to measure waste from each area, comparatively small capital expenditure, improved pipe dimensioning and no reliance on a single system covering the whole factory. Atex equipment for zoned areas is also often requested and this is well within our capabilities.
