## DC Green System

September 2008

**To “think green” is a major issue for many companies. Wouldn’t it be great to reduce environmental damage and at the same time make financial savings? The DC Green System is a concept for the control of vacuum producers and radial blowers that helps your company to save energy.**

Dustcontrol’s new concept, the DC Green System together with Turbo-pumps, can offer you an energy saving with existing or new Dustcontrol systems of 40-90 per cent. In relation to the number of users, the RPM is frequency controlled using the DC Green System. The vacuum producer automatically switches to a saving mode when it’s not in use. This smart system reduces energy consumption and therefore contributes to financial savings. Depending on individual cases and the current market price for electricity; payback time for the purchase of the DC Green System is generally between 1-5 years.

Further benefits with the DC Green System are that you will gain a more constant pressure level in your system and therefore, a more constant airflow at your outlets than in former solutions. There are no limits on how large the system can be.

Dustcontrol is a Swedish company which develops and markets stationary and mobile high vacuum extraction systems, air cleaners and suction casings for cleaning and source extraction. Dustcontrol provides a cleaner and more efficient production environment. Research and development into new and existing products is a high priority to us. Dustcontrol has its own development, production, warehouse and sales team in the same building.
